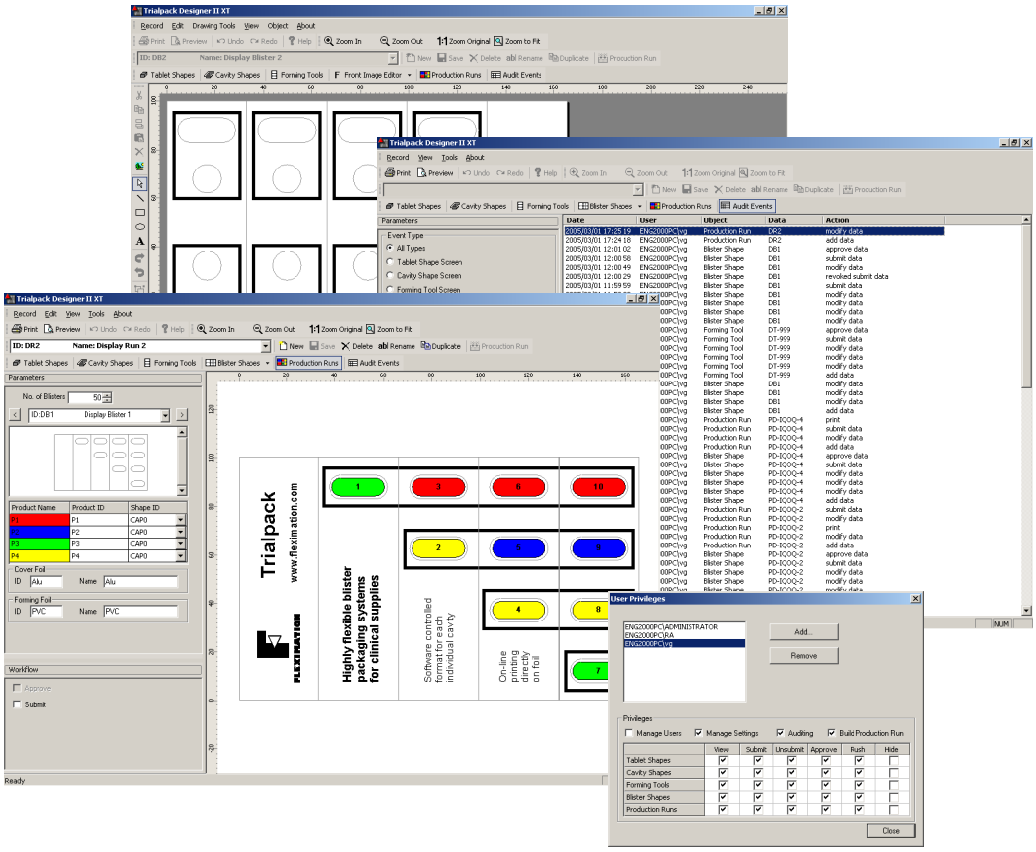
Trialpack Designer II

Blister Pack Configuration Software for Trialpack Systems



- Easy on screen definition of blister shape, blister print and blister filling pattern
- Supports workflow with electronic signatures and 21 CFR Part 11 compliant audit trail
- Hardcopy reports with detailed packaging information
- Generates complete production information for Trialpack robot systems and PC Controller

FLEXIMATION

Trialpack Designer II

Trialpack Designer II is an easy to use but powerful software for off-line configuration of Trialpack robotic packaging systems and Trialpack PC Controller systems, available for Pentapack CT and EAS type blister machines.

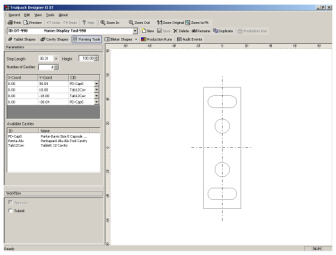
Trialpack Designer II is used to define the blister pack format, the print images on both sides of the cover foil and the blister pack filling pattern. At the end of the data entry process it generates parameter files that contain all data required to set up a Trialpack robotic packaging system or a Trialpack PC Controller, including all information to automatically configure their printing and camera systems. These parameter files are loaded by the production software of the Trialpack robotic packaging system or Trialpack PC Controller without further operator modification, guaranteeing consistent data along the flow of information.

Trialpack Designer II stores all data in a database that can be stored on a file server and accessed from multiple workstations on a computer network.

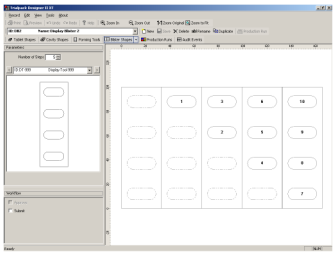
Trialpack Designer II supports a data approval workflow with double electronic signatures and is logging these, together with other quality critical events, in a 21 CFR Part 11 compliant electronic audit trail.

System Requirements

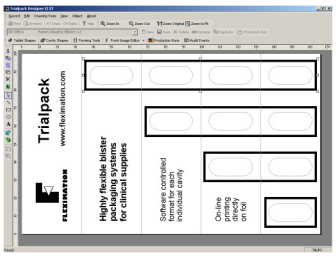
- Microsoft® Windows 2000 or XP
- 1 GHz or faster processor recommended
- 256 MB RAM or more recommended
- Screen resolution of 1024x768 or more



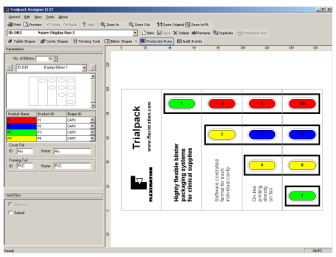
Dimensions of the forming tool and products to be used in a production batch are easily entered into the program's database and are stored for later recall for use in similar jobs.



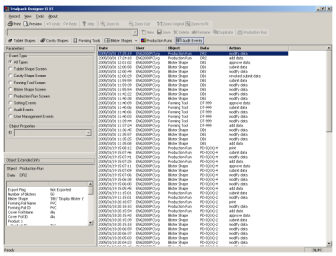
Blister pack shapes are defined by selecting the forming tool from the database, specifying the number of rows and indicating with a mouse click if a blister cavity should be formed or not.



An integrated drawing module is used to design the image for on-line printing on the full surface on the inside and outside of the blister cover foil. Monochrome graphics, such as logos, can be imported.



Packing patterns are defined simply by pulling the chosen product to the desired cavity on the blister pack. Up to four different products can be specified for a production batch.



The program records all critical operations with full user information, electronic signatures and time/date stamps into an immutable 21 CFR Part 11 compliant audit trail.
